

[illegible]

I claim:

a routing agent to change one or more communication pathways in a processor without changing a physical component layout in the processor.

3. The apparatus of claim 1, further comprising:

a point-to-point bus, the processor communicates to a device through the point-to-point bus.

4. The apparatus of claim 1, wherein the routing agent is internal to the processor.

5. The apparatus of claim 1, wherein the routing agent is external to the processor.

7. The apparatus of claim 2, wherein the control signal is selected from the group consisting of an enable signal, a disable signal, an increase clock speed signal, or a set default clock speed signal.

8. The apparatus of claim 1, wherein the processor comprises:

a protocol layer;

an information transfer layer to electronically transfer information on a physical medium between the protocol layer and a device; and

a buffer layer to buffer an electronic transfer of information between the protocol layer and the information transfer layer.

9. The apparatus of claim 8, wherein the one or more communication pathways may be changed by altering a signal path that a signal travels in the information transfer layer.

10. The apparatus of claim 8, wherein the one or more communication pathways may be changed by altering a signal path that a signal travels in the buffer layer.

11. The apparatus of claim 8, wherein the information transfer layer consists of at least one communication pathway switching device.

12. The apparatus of claim 8, wherein the buffer layer consists of at least one communication pathway switching device.

13. A method comprising:

 sending a control signal to one or more components within a processor having a flexible architecture; and

 changing one or more communication pathways in the processor without changing a physical component layout in the processor.

14. The method of claim 13, further comprising:

 communicating between the processor and a device through at least one point-to-point bus.

15. The method of claim 13, wherein the changing of the communication pathway consists of changing a setting in a configuration register to direct a routing agent to send the control signal to one or more communication pathway switching devices located in the processor.

16. A method comprising:

 changing a bandwidth between a processor and a device exterior to the processor without changing a physical component layout in the processor.

17. The method of claim 16, further comprising:

communicating between the processor and the device through at least one point-to-point bus.

18. The method of claim 16, wherein changing the bandwidth comprises altering a number of ports linked between the processor and the device.

19. A processor, comprising:

a routing agent to control one or more communication pathways in a processor;
a protocol layer to process information and generate requests for information;
an information transfer layer to transfer information on a physical medium between the protocol layer and a device; and
a buffer layer to transfer information between the protocol layer and the information transfer layer.

20. The processor of claim 19, wherein the information transfer layer consists of at least one communication pathway switching device and the buffer layer consists of at least one communication pathway switching device.

21. The processor of claim 19, wherein the routing agent comprises a first component and a second component, the first component to set a bandwidth between the processor and the device,

the second component to send a control signal to at least one communication pathway switching device.

22. A system, comprising:

a processor having a flexible architecture; and

a routing agent to control the one or more communication pathways in the processor.

23. The system of claim 22, wherein the processor comprises:

a protocol layer;

an information transfer layer to transfer information on a physical medium between the protocol layer and a device; and

a buffer layer to buffer the transfer of information between the protocol layer and the information transfer.

24. The system of claim 22, further comprising:

a point-to-point bus, the processor communicates to a device through the point-to-point bus.

25. The system of claim 22, wherein the system is selected from a group consisting of a work station, or a server.

26. An apparatus, comprising:

a means for changing the bandwidth between a processor and a device exterior to the processor without changing a physical component layer in the processor.

27. The apparatus of claim 26, further comprising:

a means for communicating between the processor and the device through at least one point-to-point bus.

28. The apparatus of claim 26, wherein changing the bandwidth comprises altering a number of ports linked between the processor and the device.

29. An apparatus, comprising:

a routing agent to change the bandwidth between a processor and a device exterior to the processor without changing a physical component layer in the processor.

30. The apparatus of claim 29, wherein the processor uses a point-to-point bus to communicate with the device.

31. The apparatus of claim 29, wherein routing agent further comprises a configuration register to alter a number of ports linked between the processor and the device
